

Key features

Overview

Product description

The MSE6-E2M is an intelligent pneumatic service unit for optimising the use of compressed air as an energy medium in industrial automation technology.

Equipped with measurement, control and diagnostic functions, the

MSE6-E2M supports energy-efficient operation of pneumatic systems. The MSE6-E2M detects increased compressed air consumption in the standard production cycle which may be caused by leakages, for example, and enables targeted system

maintenance. Furthermore, the MSE6-E2M detects when the production plant is in a standby state and stops the supply of compressed air in order to prevent unnecessary compressed air consumption.

The MSE6-E2M can also be used as a process monitoring module by enabling flow and pressure values to be transferred directly to the machine controller via a fieldbus connection, where they can be analysed.

Product features

Control function (energy efficiency function)

- Automatic shut-off when flow rate is not achieved
- User-controlled shut-off and pressurising

Recording and provision of measurement data

- Output pressure
- Pressure change (for pressure tightness testing)
- Flow
- Air consumption

Limit monitoring

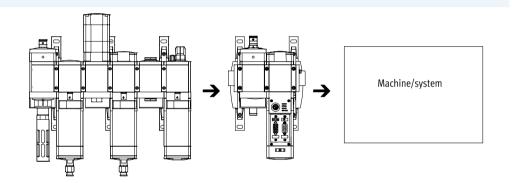

- Pressure, upper limit value
- Pressure change, upper limit value
- Flow, upper limit value

Fieldbus connection

- PROFIBUS DP
- PROFINET IO
- EtherNet/IP
- EtherCAT

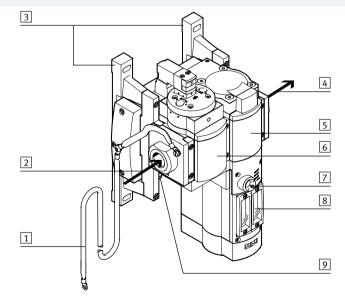

Installation

The module is typically assembled behind a service unit combination.

Structure

The main components of the MSE6-E2M are: shut-off valve, flow sensor, pressure sensor and bus node. The fieldbus interface allows complete integration into a higher-order controller, e. g. a system or machine controller. As an alternative to integration into a higher-order controller, the MSE6-E2M can also be operated using an external operator unit or a PC.

- 1 Earth terminal
- 2 Pneumatic port 1: compressed air inlet
- 3 Wall bracket
- Pneumatic port 2: compressed air outlet
- 5 Sensor module for measuring pressure, flow and consumption as well as activation of the shut-off valve
- 6 Shut-off valve for enabling and shutting off the system supply air
- 7 Service interface for external operator unit
- 8 Fieldbus interface
- 9 System supply

Key features

Functions

Standby detection and automatic shut-off of the compressed air supply

The MSE6-E2M uses settable parameters to detect when the production system is down. The system is separated from the compressed air supply using a 2/2-way shut-off valve, without exhausting the downstream system. This avoids additional air consumption through leakages. If production is to continue on the

system, then this must be signalled to the MSE6-E2M. The shut-off valve opens and the system is again supplied with compressed air. Automatic shut-off of the compressed air supply can be activated and deactivated by the user. In the deactivated state, the shut-off valve can be controlled directly by the PLC.

Pressure tightness testing

When in the shut-off state, the MSE6-E2M measures the pressure curve over time. Even in well-maintained systems, the pressure falls continuously due to leakages. The fewer leakages the

system has, the slower the pressure

drop will be. The measured pressure change serves as a measure of the leakage existing in the system. If the parameterised limit value is exceeded, then the device will output a diagnostic message.

Pressure recording

The MSE6-E2M continuously measures the output pressure, prepares the data and makes it available cyclically.

To detect high operating pressures, the MSE6-E2M offers the option of parameterising limit values for pressure. If the parameterised limit value is exceeded, then the device will output a diagnostic message.

Flow recording

The MSE6-E2M continuously records the flow, prepares the data and makes it available cyclically.

To detect high flow rates, the MSE6-E2M offers the option of parameterising limit values for the flow. If the parameterised limit value is exceeded, then the device will output a diagnostic message.

Consumption recording

The MSE6-E2M determines the compressed air consumption by recording the system flow rate. The user has the option of using appropriate signalling to record the compressed air consumption over a specific period of time.

- 🛊

Note

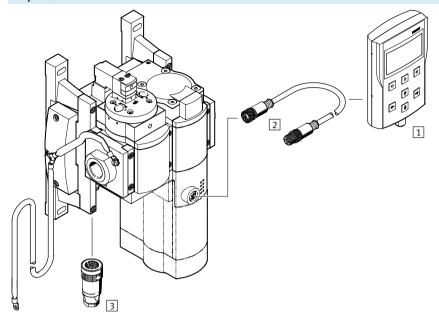

If there is an error (e.g. fieldbus interruption, PLC failure, no voltage) on the MSE6-E2M, the shut-off valve switches to the initial position (pressurise) if the system parameters are set accordingly. If the valve was previously closed, the system is

pressurized. If the system was vented, pressurisation takes place suddenly. Use suitable counter measures to prevent unintentional pressurisation of the system in the event of an error.
